1. What is the IP address of the infected Windows client?

Already the alerts are given, so I used the Ips given there to find the related packets to filter the packets. There are many packets found and the source IP is 172.16.8.49. So I assume this is the IP of the host that is affected.

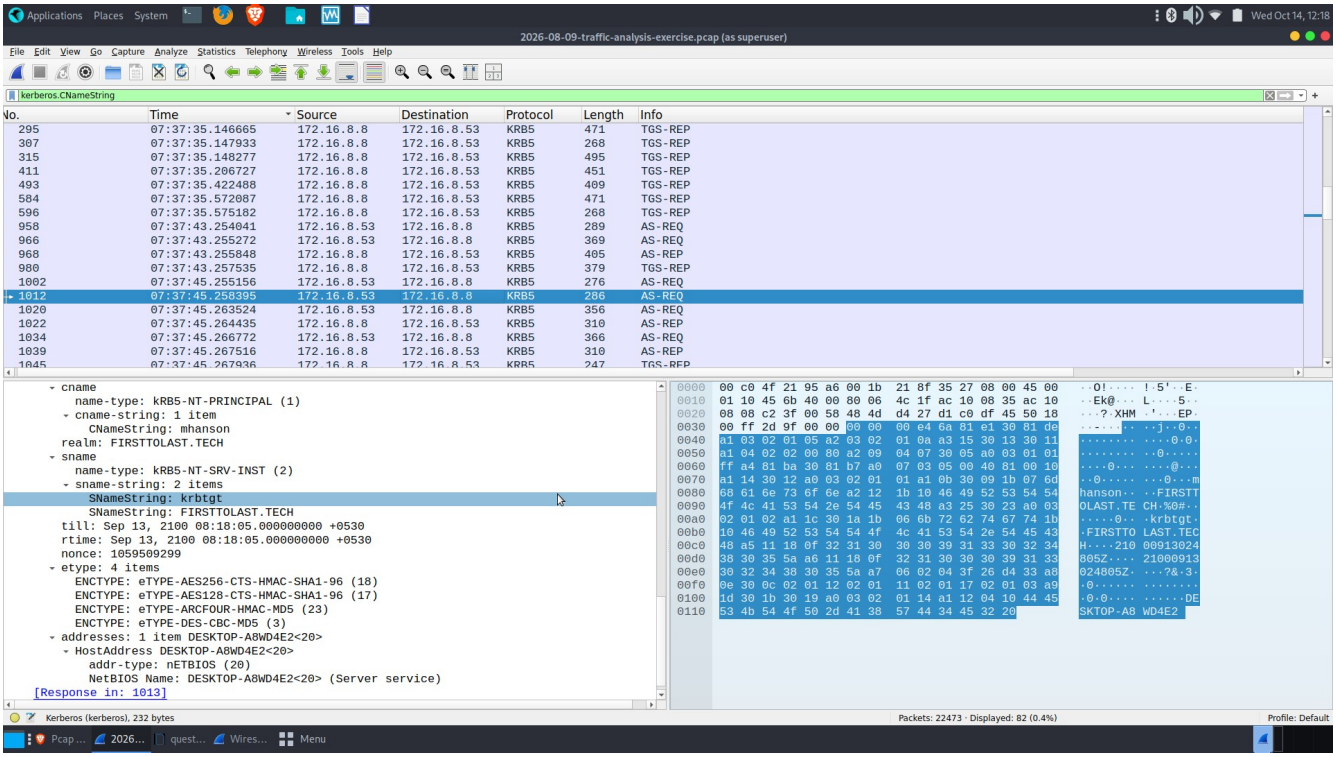

2. What is the MAC address of the infected Windows client?

I just filtered with “ip.src == 172.16.8.49 && arp || dhcp || nbns” and found the MAC address of the host from an dhcp protocol packet (00:c0:4f:21:95:a6)

3. What is the host name of the infected Windows client?
The NBNS protocol packet shows the host name: DESKTOP-5NLV63K

4. What is the user account name from the infected Windows client?
I just filtered with “kerberos.CnameString” and found some packets. While checking some packets I found the account name of the infected windows client: rvance

5. What is the full name of the user from the user account?
I used the filter “ip.addr == 172.16.8.49 && (ldap || samr)” and used find tool for searching the speific username=”vance”. Then I found the full name “Raymond vance”
